PlanO – Project Definition & Operating Model

1. Executive Summary

PlanO is a construction marketplace powered by an estimation and coordination platform. Its core purpose is to centralize the estimation phase of refurbishment and construction projects, while working exclusively with vetted local construction companies and suppliers. PlanO monetizes both the estimation phase and the execution phase through transparent, contractually enforced mechanisms.

2. Market Positioning

PlanO positions itself as the first online construction company operating through a distributed network of vetted local partners. Unlike traditional SaaS tools, PlanO does not sell software licenses to end users. Instead, it controls the transaction layer between clients, construction companies, and suppliers.

3. Two-Sided Platform Structure

3.1 End Users (Clients)

- Upload plans, sketches, PDFs, or existing drawings
- Pay a fixed estimation fee (~€100)
- Receive a detailed Bill of Quantities with accurate measurements
- Receive pricing based on real local company rates
- No site visits or repeated meetings required at this stage

3.2 Professional Partners (Construction Companies)

- Onboarded after due diligence and vetting
- Receive pre-qualified, paid leads only
- Commit to honoring PlanO-generated estimates
- Pay a 5% commission only if the project proceeds
- Gain access to material distribution and supplier margins

4. Vetted Provider Model (Core Differentiator)

All construction companies onboarded on PlanO undergo a structured due diligence process. This includes legal verification, operational capacity review, pricing validation, and reputation checks. Only approved partners are listed as 'Vetted Providers', a key trust signal for clients.

5. Revenue Model

- Fixed estimation fee paid by the client (always collected)
- 5% commission on confirmed projects

- Future margins on materials supplied through partnered warehouses

6. Control & Compliance Mechanisms

PlanO enforces compliance through a combination of contractual obligations, operational controls, and incentive alignment. Access to leads, repeat business, material margins, and platform visibility is conditioned on adherence to pricing and process rules.

- Contractual prohibition of off-platform undercutting
- Reputation scoring and performance tracking
- Selective access to high-value projects
- Progressive penalties and potential delisting

7. Geographic Expansion Strategy

PlanO expands city by city and country by country. Each new market requires supply-side density before demand acquisition begins. Initial phases are operations-heavy and focus on onboarding, vetting, and testing partners.

8. Long-Term Vision

PlanO aims to control the full construction value chain by integrating services, materials, and logistics. Over time, PlanO becomes the default operating layer for refurbishment projects, ensuring transparency, efficiency, and trust across all stakeholders.
